

FOREST TRAILS AND LANDINGS

Conservation Practice Job Sheet

ME-655

Eroding forest trails reduce site productivity and cause water quality problems

Definition

Forest trails and landings are routes, travelways, or cleared areas within a forest to provide access on a periodic basis. They are often steeper than permanent access roads and traffic may be limited or eliminated upon completion of logging or other use.

Purpose

Forest trails and landings are used to:

- Provide access to forest stands for management, removal and collection of forest products and recreation.
- Minimize on-site and off-site damage to resources during periods of access by controlling erosion during construction, during use, and upon completion of use.

Stabilized trails improve water quality and increase property values.

Use

Forest trails are used on forested areas where permanent access roads are not needed. They are not appropriate within streamside filter strips or immediately adjacent to water bodies except where needed for crossing. Landings are used for temporary storage of forest products until they are removed from the site.

Wildlife Considerations

Abandoned trails and landings offer an opportunity to provide additional wildlife food plots, bugging areas for birds, and shrubs for food and nesting cover. Areas selected for wildlife plantings include log landings, and gently sloping sections of trails where the soil is suitable for establishing vegetation with normal farming practices.

The United States Department of Agriculture (USDA) prohibits discrimination in its programs on the basis of race, color, national origin, sex, religion, age, disability, political beliefs, and marital or familial status. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD).

To file a complaint, write the Secretary of Agriculture, U.S. Department of Agriculture, Washington, DC 20250, or call 1-800-245-6340 (voice) or (202) 720-1127 (TDD). USDA is an equal employment opportunity employer.

Criteria

Forest trails and landings usually require structural measures to manage runoff and vegetative treatment to reduce soil erosion and sedimentation. Water flows must be controlled using techniques such as outsloping, broad-based dips, water bars, and rock plunge pools. Culverts and timber bridges may be used for stream crossings. Cut and fill slopes and the travel surface must be stabilized with appropriate vegetation or material. Trails that do not concentrate water and have adequate cover usually do not require treatment. New plantings must be protected from traffic with some form of use exclusion.

Broad-based Dips

Broad-based dips are shallow, wide diversions usually constructed on trails having a gradient of 10 percent or less. The bottom of the dip will be outsloped at least 4 degrees and extend the full width of the roadway (see diagram below). The dip and reverse grade section may require bedding with 3 inch crushed stone in some soils for stability to prevent rutting, and on slopes greater than 8%.

Water Bars

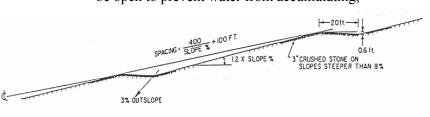

Water bars can be used on trails up to 25 percent grade and should be installed at a downslope angle of 30 degrees or less depending on the grade of the trail. Steeper trail grades require less downslope angle. The outlet of the water break should be open to prevent water from accumulating,

and be protected by a buffer or filter zone of undisturbed forest floor to clean the sediment out of the water and prevent erosion. When the site does not provide adequate outlet protection, additional practices such as plunge pools will need to be considered. Water bars and broad-based dips should be spaced according to the following table as outlet conditions allow.

Road Grade	Approx. distance	Approx.	
(percent)	between water	distance	
	bars (feet)	between	
		broad-based	
		dips (feet)	
1-2	250	500-300	
3-4	200-150	300-200	
5	135	180	
6-10	100-80	170-140	
11-15	80-60	N/A	
16-20	60-45	N/A	
21+	40	N/A	

Operation and Maintenance

Upon completion of logging, temporary measures should be eliminated or replaced with permanent bars, trails properly graded and outsloped if needed, and the entire disturbed area seeded following the recommendations on the attached specifications sheet. Trails should be inspected during the establishment period to ensure that drainage systems and structures for water control are properly functioning and that vegetation has attained full coverage.

DESIGN OF A BROAD BASE DRAINAGE DIP
